

Brief Insights

- The sales data shows that a small group of customers contributes a large portion of the total sales, making them the most valuable customers for the business.
- A few customers have total sales that are much higher than the average, while many customers have comparatively lower sales.
- Some customers placed only one order, which suggests there is an opportunity to improve customer retention and encourage repeat purchases.
- Ranking customers based on total sales helps identify the top-performing customers and supports better business decision-making.
- Using subqueries, CTEs, and window functions made it easier to analyze customer sales and answer different business questions efficiently.
- Overall, the analysis provides a clear understanding of customer purchasing patterns and highlights the customers who contribute the most to the company's revenue.
